(54) Title: COMMUNICATION DEVICE COMPRISING SOUND-CONVEYING MEANS FOR TWO SOUND-PRODUCING MODES

(57) Abstract: In a communication device (1) that is designed to deliver sound, in an against-the-ear mode, into a space (22) bounded by the ear and, in an away-from-the-ear mode, into an acoustic free space, a loudspeaker (3) is provided for generating the sound and a holding device (2) is furthermore provided, which holding device (2) comprises a first holding-device region (16) via which, in the against-the-ear mode, the sound generated by the loudspeaker (3) can be delivered without hindrance by the ear and which holding device (2) comprises a second holding-device region (15A) that does not comprise the first holding-device region (16) and via which, in the against-the-ear mode, the sound generated by the loudspeaker (3) can be fed to the space (22) bounded by the ear and a first sound-conveying device is furthermore provided with whose aid the sound generated by the loudspeaker (3) can be conveyed, in the away-from-the-ear mode, through the first holding-device region (16) into the acoustic free space, and a second sound-conveying device is furthermore provided with whose aid the sound generated by the loudspeaker (3) can be conveyed, in the against-the-ear mode, through the second holding-device region (15) into the space (22) bounded by the ear.
